Surgitel’s ErgoComfort Chair

a picture guide
Attach the backrest to the stool by depressing the knurled portion of the slide-lock and placing the slot over the tab of the upright extending from the bottom rear of the chair. Adjust to desired height.
Adjust the height of the backrest by reaching behind your back with your right hand and depressing the slide-lock. With the slide-lock depressed, the backrest can be raised or lowered as required to provide lumbar support to the operator. Release the slide-lock when backrest is at the desired height.
Control the height of the stool by lifting the front lever. To move up, you must remove your weight from the stool. To lower the height you may remain seated and lift the lever.
To adjust the tilt of the seat, lift up on the rear adjustment knob. By lifting the lever to the vertical position, the backrest and seat will move with the operator. When ‘floating’ you will be in the ‘Active Seating’ mode which provides you with constant supported posture. This lever can be returned to the horizontal (locked) position at any time, thereby locking the seat and back in any position.
To fasten Armrest...

1) attach the t-bar with the two hex screws supplied...

2) adjust and tighten the height-control knob while...

3) assuring that a half inch space exists between the end of the armrest and the seat’s backrest.

Use the knob on rear of t-bar to control the rotational friction of the assembly.
Turn the tension adjustment clockwise (to the right as you are looking at it) to increase the vertical tension of the armrest.

Turn the tension adjustment counter-clockwise (to the left as you are looking at it) to decrease the vertical tension of the armrest.

You will need to turn the a few times to feel any measurable change in the tension.

You should attempt to find the tension which will allows your arm to levitate.
ASSISTANT ARM SETUP

If an Assistant Arm was purchased, insert the armrest into the chrome J-Bar. Note that the armrest ratchet assembly has a flattened channel on one side. This flat side must align with the black height adjustment knob on the rear of the J-Bar for the ratchet to operate properly. After proper installation of the armrest, adjust the height as necessary by using the adjustment knob.
The armrest height can be adjusted by loosening the black control knob on the rear of the J-Bar and raising or lowering the arm as necessary. When at desired height, tightly secure the adjustment knob.
The armrest can be used as an abdomen support by pulling the arm in toward you as you sit on the stool. To release the armrest, push in on the chrome lever on the exterior of the arm and push away from you. Note-all positive pressure/weight must be removed from the armrest in order to depress the lever.
Adjust the footring height by loosening the control-knob on the footring and raising/lowering as necessary. The goal is to have the operators hips about 1/2 of an inch higher than their knees. Feet should be placed firmly on the footrest.
Your SurgiTel Stool will provide you with many years of comfort and support. We encourage you to contact SurgiTel at 800-959-0153 with any questions regarding the set up or operation of our products.
